

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

THE BANK SWALLOW.—As a bird of Lorain Co., Ohio, the Bank Swallow has been considered common in summer, breeding in small numbers in suitable places. The larger number have been found nesting in the clay banks fronting on Lake Erie, but even here occurring in colonies of scarcely a dozen pairs. But this season there is a colony of about five hundred pairs nesting in a clay bank, the top of which is scarcely above the storm-wave mark. This colony is but a short distance from the banks where a few pairs of Swallows have nested every year. The nest cavities lie along the face of the bank from one to ten feet below the top of the bank, and are so numerous in places that the partitions of earth between them have fallen out, leaving one large cavity. The perpendicular face of the bank is worn smooth by the feet and wings of the birds as they alight.—LYNDS JONES, *Oberlin, Ohio*.

NOTES FROM PENNSYLVANIA.—This winter a flock of Pine Grosbeaks have been in our woods. I saw them first December 7, but think they had been here a month before that, as I recognized their note as one heard before but not identified. They are still here (April 8), as yesterday two females were near my door on the ground eating dry dead leaves. I find they are walkers, though they hop sometimes as well. When first seen I could find none among them in full male plumage, but many with patches of pinkish-red in all sorts of variations; but about March 1st I saw three males in full dress. Several times I have heard their song, delivered from the top of a tall tree, where the singer remained a long time repeating his delightful notes, but always as if *whispered*, low, under the breath, we should say, if it were a person singing. The song has much in common with that of the Purple Finch. I have heard other birds whisper their songs (if that is the proper way to express my meaning)—the Robin and Wood Thrush. Once a Wood Thrush sang three days near our house, and his voice sounded hoarse, as if he had such a cold he could not bring out the notes as he wished to, and it seemed to trouble him very much. There had been severe, long continued storms, and I dare say he had a cold. Another time, early in the Spring, a Robin always missed one note in his song, and that appeared to come from a huskiness in his throat. It was always the same note that failed to materialize. In the same way a White-crowned Sparrow, one spring during his call upon us, always skipped one note in his song. The same note each time and an interval left for that note. I heard this three days in succession. Once I saw two White-crowned Sparrows sing a duet. They were taking their breakfast from the lawn and not more than a yard
